TARIFF FORMAT

- A. Page Numbering: Page numbers appear in the upper right corner of the page. Pages are numbered sequentially. However, new pages are occasionally added to the tariff. When a new page is added between pages already in effect, a decimal is added. For example, a new page added between pages 4 and 5 would be 4.1.
- B. Page Revision Numbers: Revision numbers also appear in the upper right corner of each page. These numbers are used to determine the most current page version on file. For example, the 4th revised Page 4 cancels the 3rd revised Page 4. Because of various, suspension periods, deferrals, etc. the Commission follows in the tariff approval process, the most current page number on file is not always the tariff page in effect. Consult the check sheet for the page currently in effect.
- C. Paragraph Numbering Sequence: There are nine levels of paragraph coding. Each level of coding is subservient to its next higher level:

2
2.1
2.1.1
2.1.1.A
2.1.1.A.1
2.1.1.A.1.(a)
2.1.1.A.1.(a).I
2.1.1.A.1.(a).I.(i)
2.1.1.A.1.(a).I.(i).(1)

- D. When a tariff filing is made, an updated check sheet accompanies the tariff filing. The check sheet lists the pages contained in the tariff, with a cross reference to the current revision number. When new pages are added, the check sheet is changed to reflect the revision. All revisions made in a given filing are designated by an asterisk (*). There will be no other symbols used on the check sheet if these are the only changes made to it (i.e., the format, etc. remains the same, just revised revision levels on some pages). The tariff user should refer to the latest check sheet to find out if a particular page is the most current on file with the Commission.

3 DESCRIPTION OF SERVICES (CONT.)

3.3 Calculation of Distance ("V & H")

Usage charges for mileage-sensitive products are based on the airline distance between serving wire centers associated with the originating and terminating points of the call.

The service wire centers of a call are determined by the area codes and exchanges of the origination and destination points.

The distance between the wire center of the customer and that of the destination point is calculated by using the industry standard vertical ("V") and horizontal coordinates ("H") coordinates.

Step 1: Obtain the V and H coordinates for the wire centers serving the customer and the destination point.

Step 2: Obtain the difference between the V coordinate of each wire center. Obtain the difference between the H coordinates.

Step 3: Square the differences obtained in Step 2.

Step 4: Add the squares of the V difference and the H difference obtained in Step 3.

Step 5: Divide the sum of the squares obtained in Step 4 by 10. Round to the next higher whole number if a fraction remains from the division.

Step 6: Obtain the square root of the whole number obtained in Step 5. Round to the next higher whole number if a fraction remains.

$$\text{Mileage} = \sqrt{\frac{(V_1 - V_2)^2 + (H_1 - H_2)^2}{10}}$$
